                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (AAB35987 - AAB35989). Also included in the invention are two polymucleotide sequences AAC83156 and AAC83157 which contain the subunit coding regions. The sorbitol dehydrogenase polymucleotide sequences are useful for producing L-sorbose from D-sorbitol and for increasing the production of 2-keto-L-gulonic acid by transforming a host cell, especially Gluconobacter with the DNA and selecting the transformed host cell. Note: An additional 66 DNA sequences (fragments of the SDH subunit genes) encoding fragments of SDH are specifically claimed, however these sequences are not given separately in the specification but are included in sequences AAC83156 and AAC83157.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to an isolated membrane-bound sorbitol dehydrogenase (SDH) from Gluconobacter oxydans. The invention includes polymucleotides (AAC83153 - AAC83154) encoding the 3 subunits of SDH (AAB35987 - AAB35989). Also included in the invention are two polymucleotide sequences AAC83156 and AAC83157 which contain the subunit coding regions. The sorbitol dehydrogenase polymucleotide sequences are useful for producing L-sorbose from D-sorbitol and for increasing the production of 2-keto-L-gulonic acid by transforming a host cell, especially Gluconobacter with the DNA and selecting the transformed host cell. Note: An additional 66 DNA sequences (fragments of the SDH subunit genes) encoding fragments of SDH are specifically claimed, however these sequences are not given separately in the specification but are included in sequences AAC83156 and AAC83157.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 4830 BP; 1071 A; 1424 C; 1350 G;

                                                                                                                                                                                                                                                                                                         This invention describes novel DNA sequences (I) that encode iron or CC heavy metal transporters (II). The invention also describes (I) a CC recombinant expression vector (III) containing (I); (2) prokaryotic or CC eukaryotic cells (III) transformed with (I) or (III); (3) production of CC (II) by culturing (III); (4) (partial) expression products (IV) of (I) CC and synthetic proteins or peptides with the same sequences; (5) CC antibodies (Ab) specific for (IV); (6) hybridoma cells that produce CC monoclonal Ab; and (7) transgenic plants that contain (III). The iron or CC heavy metal transporters encoded by (I) transport heavy metal ions across CC cell walls and regulate homeostasis of trace elements. (I), and their CC fragments are useful for: (1) expression of (II); (2) as probes and CC primers for detection, isolation and amplification of full length cDNA CC sequences; and (3) producing transgenic plants. (III) are used to promote CC growth, development and yield of plants, particularly Leguminosae, CC cells that express the iron or heavy metals injurious to CC plants. They also improve homeostasis of iron and trace elements. Host CC cells that express the iron or heavy metal transporters take up heavy CC metals which improves soil quality and protect plants against pollutants CC from the soil improves soil quality and protect plants against pollutants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (TIGR-)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen, Mycobacterium tuberculosis or related Mycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nucleotide sequences of M. tuberculosis strains CDC 1551 (AAI99683) and H37RV (AAI99682). The method is useful for evaluating strain variation of M. tuberculosis and has valuable application in the fields of tuberculosis genetics, epidemiology, patient treatment and epidemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Evaluating strain variation of Mycobacterium tuberculosis, comprises determining the nucleotide sequence of the strain at positions in the genome corresponding to positions where M. tuberculosis strains CDC 1551 and H37Rv differ -
                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 4; SEQ ID NO 2; 3pp + Sequence Listing; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          mixture was used to transform E.coli JM109. Probes were designed based on the N-terminal amino acid sequence of the 72kD subunit of the ADH complex isolated from A. altoacetigenes (see AAQ13582-Q13584). Fragments encoding the 44kD (cytochrome c) ADH subunit were identified using anti-44kD subunit antibodies in a Western blot. The gene was sequenced. Various experiments suggested that the coding sequence is located immediately downstream of the gene encoding the 72kD sub-unit. See also AAQ13580. (Updated on 25-MAR-2003 to correct PA field.)

                                                                                                                                                                                                                                                                                            The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European batent of fice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nakagawa

glutamate, alanine, aspartate, glycine, serine, threonine, methionine, cysteine, valine, leucine, isoleucine, arginine, proline, histidine, tyrosine, phenylalanine, or tryptophan. The fine chemical production can be modulated. The presence of (I) or HA proteins encoded by then are used for diagnosing the presence or activity of Corynebacterium diphtheriae. (I) can be used to map the C. glutamicum genome or can be used as markers for genetically engineered Corynebacterium or Brevibacterium. The HA proteins encoded by the (I) are used to maintain homeostasis in C. glutamicum or help the microorganism to adapt to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and adaptation (HA) proteins given in AAB79023 to AAB79242. The C. glutamicum HA genes (I) can be used in vectors for expression in host cells and production of fine chemicals, such as, an organic acid, proteinogenic or nonproteinogenic amino acid (preferred), purine or pyrimidine base, nucleoside, nucleotide, lipid, saturated or unsaturated fatty acid, diol, carbohydrate, aromatic compound, vitamin, cofactor, polyketide or enzyme. The anino acids produced can be lysine, glutamine, alanine apartters of acids produced can be lysine, glutamine,
different environmental conditions.

Disclosure; SEQ ID NO: 7062; 246pp + Sequence Listing; English

mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office. The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. Tare useful for identifying the mutation point of a gene derived from present These മ

The mutation is a deletion, insertion or pref. a substr. of one or more amino acids at a location no greater than 12 Angstroms, pref. no more than 2.5 Angstroms, from the Type I copper site. The mutant enzyme is expressed in transformed host cells for use e.g. in the polymerisation or depolymerisation of lignin, oxidation of dyes,
